PLACEMENT PREPARATION TRACKER

Abstract

PLACEMENT PREPARATION TRACKER is a website made for junior students to learn from the placement experience of their seniors. Many students do not know how to start preparing for placements or which skills a company expects. This website solves that problem by showing real stories shared by seniors who have already gone through the placement process.

Each story on the website shows the company name, the role and package, the skills the senior learned, and a step by step roadmap of how they prepared from the very beginning until they got placed. Seniors also share resume tips and the mistakes they made, so juniors do not repeat the same mistakes. Students who were not placed can also share their experience, so juniors can learn what went wrong and avoid those mistakes too.

The website has a dashboard that shows the total number of stories, how many students got placed, and how many companies are covered. Users can search by company, role or skill, and filter stories as placed or not placed. Clicking on a story opens the full details in a pop up window, including the roadmap, interview rounds, resume tips and mistakes.

The website is built using HTML, CSS and JavaScript. HTML is used to create the structure of the pages, CSS is used to design and style the website, and JavaScript is used to add the search, filter and pop up features and to make the website interactive.

The main goal of this project is to help junior students prepare better for placements by learning directly from their seniors' real experiences, instead of searching randomly on the internet for placement tips.

Domain

This project comes under the domain of Web Development. The complete website — every page, every style, and every feature — is built using only HTML, CSS and JavaScript, without depending on any outside framework or library. This was done on purpose, so that every line of code in the project could be written and understood by our own team, and so that the working of the website stays simple and easy to explain.

At the same time, this project also comes under Education and Career Guidance, because the actual purpose behind building the website is not just to practice coding, but to genuinely help junior students during one of the most confusing periods of their college life — placement preparation. The website acts as a bridge between seniors who have already been through the process and juniors who are just getting started, so it fits naturally into both the technical domain of web development and the practical domain of student guidance.

Motivation

Every year, junior students struggle to understand how to prepare for placements. They do not know which skills a particular company expects, how many months of preparation are actually needed, which subjects to focus on first, or what common mistakes to avoid. Most of the time, this information is scattered across LinkedIn posts, YouTube videos, and random blogs, or it is passed on informally through word of mouth from one senior to another. None of this is organized, and a lot of useful detail gets lost along the way.

This project was motivated by our own experience of searching for placement guidance and not finding everything in one place. We wanted juniors in our own college to have a single website where they could see exactly what their seniors did — from the very first day they started preparing, all the way to the day they got placed — instead of piecing together advice from many different, unreliable sources.

We also noticed that most placement-related pages online only celebrate success stories and completely ignore students who prepared hard but were not placed. But there is just as much to learn from an unsuccessful attempt as there is from a successful one, because it shows the exact mistakes to avoid. This is why our website was built to include both placed and not placed experiences equally, so that juniors get a complete and honest picture of placement preparation, not just a filtered highlight reel.

Key Functionalities

- **Dashboard:** Shows the total number of stories, placed seniors count, and companies covered, so students get a quick overview.
- **Search and Filter:** Students can search by company, role or skill, and filter stories as placed or lessons shared.

- **Company Section:** Shows the list of companies covered so students can quickly find a company they are targeting.
- **Story Cards:** Each story shows the senior's name, company, role, package and status at a glance.
- **Full Story Pop-up:** Clicking a story opens the full details — the senior's journey, skills learned, interview rounds, roadmap, resume tips and mistakes to avoid.
- **Share Experience:** Seniors can share their own placement journey so the website keeps growing with new stories.

Technologies

- Frontend: HTML, CSS, JavaScript
- No backend or database is used right now — all story data is stored directly in the JavaScript file. This can be upgraded to use a database in the future so that anyone can add stories permanently.

Existing Systems

Right now, students mostly depend on LinkedIn posts, YouTube videos, placement WhatsApp groups, or word of mouth from seniors to know about placement experiences. Each of these sources only gives a small, disconnected piece of the picture — a LinkedIn post might mention the company and package but skip the actual preparation roadmap, while a YouTube video might explain a general strategy without telling students which specific skills a particular company tested. Because this information is scattered across so many different places, a junior student ends up spending more time searching for guidance than actually preparing for placements.

There is currently no single, organized place in our college where a junior can go, pick a company they are targeting, and see the complete journey of a senior who got placed there — the skills, the timeline, the interview rounds, and the mistakes to avoid — all together in one view.

Proposed System

PLACEMENT PREPARATION TRACKER is proposed as a single website where all senior placement experiences from our college are collected and organized in one place, replacing the need to search across many scattered sources. The system is designed around a few simple ideas:

- Students can search and filter stories by company, role or skill, instead of searching across multiple platforms one by one.
- Every story follows the exact same format — company, role, skills, roadmap, resume tips and mistakes — so that comparing one senior's journey with another becomes quick and easy.

- Both placed and not placed experiences are included side by side, giving juniors a complete and honest picture of placement preparation, rather than only success stories.
- A dashboard on the homepage instantly shows how many stories exist, how many seniors were placed, and how many companies are covered, so a junior gets a quick overview the moment they open the website.

Conclusion

PLACEMENT PREPARATION TRACKER makes placement preparation easier for junior students by giving them access to real experiences from their own seniors, collected and organized in one single place. Instead of searching randomly across the internet, students can directly see which skills to learn, how to structure their preparation timeline, and what mistakes to avoid for the exact company they are targeting.

The project also proves an important point — that a simple website, built using only HTML, CSS and JavaScript without any advanced framework, can still solve a real and everyday problem faced by students every placement season. It does not need to be complicated to be genuinely useful; it just needs to bring the right information to the right people, in a place they can easily find it.

Future Work

- **Adding a Database:** Right now story data is stored in the code itself. In the future, a database can be added so that any senior can permanently add their story without needing a developer to update the code.
- **Login System:** A login system can be added so that only verified seniors from the college can submit stories, keeping the information trustworthy.
- **More Filters:** More filters like branch, year, and CGPA can be added so juniors can find stories that match their own profile more closely.
